LIQUID-CRISTAL DISPLAY AND THE METHOD OF ITS FABRICATION

5

Field of the Invention

Invention is related to the field of electronics and can be used for making information displays, in particular, liquid crystal (LC) indicators, screens, panels etc.

10

Prior Art

15

The drawback of the majority of liquid crystal displays is a strong dependence of their transmission on the angle of light incidence [S.T.Wu, C.S.Wu, SID Digest 27, 763 (1996)-1] and, as a result, decrease of contrast and even inversion of transmission levels at some observation angles. For improving these characteristics of displays in many cases a set of retardation plates is used [N.Yamagishi, H.Watanabe, K.Yokoyama, 'Japan Display 89', 316 (1989)-2], which increases the cost of the device and does not resolve the problem of color inversion.

20

The most promising from this point of view are multi-domain LC displays, in which a single pixel contains areas with various orientations of the liquid crystal in the plane of substrates [M.Schadt, Proc.SID'97, 24.1 (1997)-3].

25

There is an information display [K.-H.Kim, S.-B.Park, J.-U.Shim, J.-H.Souk, J.Chen, SID 98 DIGEST, 1085 (1998)-4], which consists of two plane and parallel substrates with electrodes deposited at least on one of them, the said substrates are overlaid with the electrodes facing each other. The space between the substrates is filled with a homeotropically aligned liquid crystal mixture possessing positive anisotropy. From the outside the substrates are surrounded by two crossed polaroids. In the off state this display does not transmit the light. After electric voltage of the opposite polarity is applied to the neighboring electrodes at one of the substrates, a parabolic electric field is created between the said electrodes, which reorients the liquid crystal parallel to it. In this way it is possible to orient LC molecules between the

30

electrodes in two different directions (the so-called two-domain structure) and as the result, the viewing angle of such display is improved considerably. To maximize the brightness polaroids are oriented at 45° to the electrodes. Nevertheless, low brightness is the drawback of this display, as well as of other displays based on director re-switching in the plane of the substrates [M.Ohta et al, Asia Display'95, 707 (1995)-5]. Another drawback is that it is impossible to have more than two domains in a pixel.

There is display [S.-C. A.Lien, R.A.John, Patent USA, US5,309,264-6], [S.-C. A.Lien, R.A.John, et al, SID 98 DIGEST, 1123 (1998)-7], in which two principles are used to have domain structure: fringe field, which arises at the edge of the electrode after applying electric field, and ridge field at the opposite slopes of the protrusions formed lithographically at the opposite substrates with color filters. Protrusions act as elements which incline LC director from the normal to the substrate. The space between the substrates is filled with homeotropically aligned liquid crystal possessing negative dielectric anisotropy. Liquid crystal molecules are aligned perpendicularly to the substrates surface and in the off state this display does not transmit the light (crossed polaroids) and only on the slopes of protrusions the molecules deviate from the normal to the angle which equals the angle between the slope of the protrusion and the substrate. At the slopes the molecules are pre-tilted in different directions, but pre-tilt is not high and therefore it does not perturb optical parameters of display in the off state. Within the pixel protrusions are oriented so that the pre-tilt direction coincides with the direction of the fringe field which arises at the long edge of the pixel (the pixel has elongated rectangular shape). In such display co-action of the fringe electric field and protrusions result in reorienting LC molecules within the pixel in different directions relative to the long axes of the protrusions. The drawback of such device is that although it is possible to have four domains within a pixel (this number of domains is optimal for equalizing optical characteristics in different directions), but in a real display these domains have different area and it is difficult to equalize optical characteristics completely. Besides this, the fringe field which arises around the pixel after applying electric voltage is distorted by connecting buses and this results in non-uniform switching of various domains within a pixel.

The closest to the proposed devices and method is technical reference [A.Takeda et al, SID 98 DIGEST, 1077 (1998)-8]. This display consists of two substrates with the pattern of electrodes

deposited on them, on the said electrodes protrusions are deposited photolithographically with the slopes in different directions. These protrusions like similar elements in [7] tilt the LC director from the normal of the substrate. The space between the substrates is filled with homeotropically aligned liquid crystal possessing negative dielectric anisotropy. In the off state the LC molecules are orthogonal to the substrates except those in the areas where the protrusions are displaced. At the slopes of the protrusions the molecules are pre-tilted to the angle, which equals the angle between the slope and the substrate. This pre-tilt is not high and does not perturb optical characteristics of the display in the off state and in crossed polaroids display does not transmit the light. When the voltage is applied to the electrodes at the opposite substrates this pre-tilt is sufficient to initiate molecular reorientation in different directions within the pixel area. This leads to appearing domains and makes viewing angle more uniform. The drawback of this display is low brightness (30% of conventional single-domain display) because of two factors: protrusions occupy more than 30% of the display area and to realize four domains very specific pattern of the protrusions is required, which leads to additional losses of light. Besides this to make this display two additional photolithographies are required.

Summary of the Invention

Present invention is aimed to make displays with wide viewing angle possessing higher brightness in transmission mode and to develop more simple method for making such displays.

This target is achieved by making in display with multiple pixels deflecting elements of dielectric material and depositing them over the electric conductive coating at least on one of the substrates the space between which is occupied by liquid crystal. Dielectric elements can have profile as from the liquid crystal side, so from the side of the substrate. They can be deposited on both, as well as only on one substrate. Dielectric deflecting elements may be displaced along the perimeter of the pixel as well as across its area. After applying electric voltage to the electrodes at the opposite substrates at the interface LC-dielectric deflecting element distortions of the electric field appear with the component of electric field parallel to the substrates. Direction of this in-plane component is determined by the configuration of the dielectric deflecting elements. The value of this component is sufficient to reorient liquid crystal in different directions and hence to generate different domains within the pixel area and to make optical properties of display independent of the viewing angle. Unlike in the known display [8],

dielectric elements take not more than 5-10% of the pixel area and proposed display has higher brightness. At the same time configuration of the dielectric elements is capable of obtaining two- as well as four domain displays for any real pixel shape.

5 Brief Description of the Drawings

Figs.1-2 show the cross-section (a) and the top view (b) of the proposed display, fabricated according to the proposed method with various displacement of the dielectric deflecting elements.

10

Fig.3 shows the cross-section (a) and the top view (b) of the proposed display, fabricated according to the proposed method, in the said display the dielectric deflecting elements are displaced at the color filters substrate and play the role of the black mask.

15 Fig.4 shows the top view of the displays fabricated according to the proposed method with various displacement of the dielectric deflecting elements.

20 Figs.5-8 show the cross-section (a) and the top view (b) of the proposed display, fabricated according to the proposed method with various displacement of the dielectric deflecting elements in the cases when these elements have profiled thickness at the side of the substrate.

Fig.9 shows the cross-section (a) and the top view (b) of the proposed two-domain display, fabricated according to the proposed method with planar alignment of the liquid crystal.

25 Detailed Description of the Preferable Embodiments

The proposed displays are fabricated as following.

30 On one or both substrates with aligning layer deposited on them dielectric deflecting elements are patterned on the top of the last electric conductive layer. Resistivity of the deflecting elements should not be substantially lower than that of the liquid crystal material, the last is usually higher than 10^8 Ohm/cm.

Deflecting elements are usually formed photolithographically. Most often they have shape of solid or dashed lines with the intervals between the dashes 5-30 μm , the line-width 2-3 μm and larger and the height (or depth) from 0.1 μm up to the LC thickness. The cross section of the deflecting dielectric elements may have the shape of any geometric figure, such as triangle, turned with one side to the substrate, trapezium, rectangle, semicircle e.t.c. Deflecting dielectric elements are patterned to have the form of lines of any type surrounding the pixel. If pixel has elongated shape, it may be subdivided by deflecting elements into squares, or rectangles with the shape close to squares. Deflecting elements may be displaced in the gap between the electrodes and cover part of the electrode with the width comparable to the height of the element in order to avoid the influence of the fringe field on the LC orientation. The area between the deflecting elements may be filled with supplementary coatings (variants with the deflecting dielectric elements profiled from the side of the substrate). Supplementary coatings may play the role of planarizing film, or color filters matrix, or various conductive layers. This may be the areas of the substrate, between which the wells are made, which are filled with the deflecting dielectric elements.

At the second substrate deflecting elements are also deposited to have a shape of squares, or rectangles with the shape close to squares with the same dimensions as on the first substrate, or with different dimensions, or having shape of solid, or dashed lines of various form.

In the case when matrix of color filters is formed at the second substrate, deflecting dielectric elements usually align with the black matrix, or replace them by dielectric black matrix. In the latter case one technological operation is reduced.

Deflecting dielectric elements on different substrates can be made of different materials. For example, when on the color filter substrate deflecting dielectric elements are replaced by the black matrix, on the second substrate they are made from as transparent material as possible to reduce the losses of light. The height of the deflecting dielectric elements may vary across the substrate and may be different on different substrates. The first case can be useful to make displays with variable viewing angle across the display area.

At the next stage aligning layer for homeotropic or planar alignment is deposited at the substrates.

To control the gap between the substrates in the case when deflecting elements are deposited only on one substrate conventional spacers, such as spheres, or fibers, or particles of definite dimensions made of inorganic as well as organic materials are used. In the case when deflecting elements are deposited on the electrodes on both substrates and have profile from the side
5 turned to the liquid crystal, additional spacers are not necessary because deflecting dielectric elements play the role of spacers. Simultaneously, the display becomes more rugged and the LC layer thickness can be easily varied during fabrication process.

At the next stage of fabricating display with deflecting dielectric elements deposited on one
10 substrate this substrate is overlaid with another one, containing pattern of electrodes, aligning layer and conventional spacers with the said electrodes faced to each other on both substrates and is sealed along the perimeter.

In the case the display has deflecting dielectric elements on both substrates with the profile
15 from the liquid crystal side to obtain equally good viewing characteristics for all observation angles these deflecting elements are aligned so that the crossings of the lines on one substrate be as close as possible to the centers of the squares formed by deflecting dielectric elements on the second substrate. After this display is sealed.

20 If at least on one of the substrates deflecting dielectric elements are profiles from the side of the substrate, then the substrates are aligned similarly to the previous case, but conventional spacers are used to control the gap between the substrates.

As a rule, liquid crystal domains are formed of equal size to make viewing characteristics
25 independent of angle. Nevertheless, they can have different size if display should have specific viewing characteristics.

The space between the substrates is filled with liquid crystal.

30 This liquid crystal can possess either positive or negative dielectric anisotropy. Consequently, the said liquid crystal may have either planar or homeotropic alignment. Planar aligning material is rubbed. The angle between the rubbing direction and the deflecting dielectric elements may

be taken in the range $0^\circ - 180^\circ$. Both non-chiral and chiral liquid crystal materials are appropriate. In the case it is chiral and has planar alignment it may be twisted to the angle from 0° to 360° . If it has homeotropic alignment, its twist angle should be chosen so that $d/p < 0.5$ (here d - LC layer thickness, p - its spontaneous helix pitch).

5

In the proposed displays liquid crystal doped with a dichroic dye can be used and then such display may operate without polaroids and information is displayed due to light absorption by the dye molecules. The dichroic ratio of the dye can be larger or smaller than 1 and liquid crystal may be chiral or non-chiral.

10

Proposed displays can operate in reflective mode. In such a case one of the substrates and the electrode deposited on it are made non-transparent (reflective). The image is obtained with one polaroid.

15 Fig.1 shows the cross-section (a) and the top view (b) of the proposed display, fabricated according to the proposed method. On two plane glass substrates 1 and 2 0.5-2 mm thick and with linear dimensions on the range of 1 cm to several decimeters transparent electrodes from conductive coating 3 having thickness 70-150 nm and surface resistivity 10-2000 Ω/\square are deposited in vacuum from the oxide of the indium-tin alloy. The desirable electrode pattern is made photolithographically. On one substrate deflecting dielectric elements 5 are formed from photoresistive dielectric material, for example AR P-310, which have the shape of crossing lines with the pitch 100 μm , width 5-7 μm and height 2.5-3 μm . Both substrates 1, 2 are covered with homeotropic aligning layer 4, for example AL-655 (JSR), 20-100 nm thick. Conventional spacers, like plastic spheres 3-6 μm in diameter, are deposited on one of the substrates 1, 2.

20 The substrates 1, 2 are overlaid with the aligning layers 4 faced to each other and fixed together with the sealing material having epoxy base, for example UHU plus endfest 300. The space between the substrates 1, 2 is filled with liquid crystal possessing negative dielectric anisotropy, such as MLC-6608. So made display transmits 45-50% of light in the on state in crossed polaroids (for 100% we take the light transmitted by display in the off state between the parallel

25

30 polaroids).

Fig.2 shows the cross-section (a) and the top view (b) of the proposed display, fabricated according to the proposed method. On two plane glass substrates 1 and 2 on the top of the conductive layer 3 deflecting dielectric elements (5), (6) are deposited in the form of crossing lines with the width 5-6 μm , their height is 2.0-2.5 μm and the pitch - 100 μm . The substrates 1, 2 are aligned so, that line crossings on one substrate are close to the centers of the squares formed by the lines on the second substrate. The crossings of the lines on different substrates are used as spacers. Single pixel abcd is surrounded by thicker vertical lines and two horizontal lines placed at the bottom substrate 1. So made display transmits 75-80% of light in the on state in crossed polaroids.

Fig.3 shows the cross-section (a) and the top view (b) of the proposed display, fabricated according to the proposed method, in which deflecting elements 5 at the color filters substrate are made of non-transparent dielectric material and have the form of lines 5-15 μm thick with the height 2-2.5 μm above the color filters surface. Simultaneously these deflecting elements play the role of the black matrix. Pixel abcd is surrounded by peripheral vertical lines and two horizontal lines placed at the bottom substrate 1. In other aspects the display is made similarly to that one described in fig.2. This display has brightness 60-80% in the on state.

Fig.4 shows the top view of the proposed displays fabricated according to the proposed method with various displacements of the deflecting dielectric elements 1 and 2 on the bottom and the top substrates respectively. Single pixel is displayed. In other aspects the display is made similarly to that one described in fig.2. This display has brightness 75-80% in the on state.

Fig.5 shows the cross-section (a) and the top view (b) of the proposed display, fabricated according to the proposed method. On the bottom 1 and top 2 substrates containing the electrodes pattern 3 deflecting dielectric elements 5 and 6 are deposited. On the bottom substrate 1 the area between the dielectric deflecting elements is filled with a supplementary layer 7 possessing dielectric constant different from that of the deflecting elements (dielectric deflecting elements are profiled from the side of the substrate). On the top of all patterns on both substrates 1, 2 homeotropically aligning layer 4 is deposited. Conventional spacers, like plastic spheres 3-6 μm in diameter, are used. Pixel abcd is surrounded by thicker vertical lines

and two horizontal lines placed at the bottom substrate 1. In other aspects the display is made similarly to that one described in fig. 1. This display has brightness 75-80% in the on state.

Fig.6 shows the cross-section (a) and the top view (b) of the proposed display, fabricated according to the proposed method. On the bottom 1 and top 2 substrates containing the electrodes pattern 3 deflecting dielectric elements 5 and 6 are deposited. On the bottom substrate 1 the area between the dielectric deflecting elements is filled with a supplementary layer 7 possessing dielectric constant different from that of the deflecting elements (dielectric deflecting elements are profiled from the side of the substrate). On the top of the supplementary layer 7 conductive coating 3 is deposited. On the top of all patterns on both substrates 1, 2 homeotropically aligning layer 4 is deposited. Conventional spacers are used. Pixel abcd is surrounded by thicker vertical lines and two horizontal lines placed at the bottom substrate 1. In other aspects the display is made similarly to that one described in fig.1. This display has brightness 75-80% in the on state.

Fig.7 shows the cross-section (a) and the top view (b) of the proposed display, fabricated according to the proposed method. On the bottom 1 and top 2 substrates containing the electrodes pattern deflecting dielectric elements 5 and 6 are deposited. On the bottom substrate 1 the area between the dielectric deflecting elements 5 is filled with a supplementary layer 7 possessing dielectric constant different from that of the deflecting elements (dielectric deflecting elements are profiled from the side of the substrate). On the top of the supplementary layer 7 conductive coating 3 is deposited. On the top of conductive coating 3 the film made of material of the deflecting dielectric element is displaced and covered with the aligning film 4. Conventional spacers are used. Pixel abcd is surrounded by thicker vertical lines and two horizontal lines placed at the bottom substrate 1. In other aspects the display is made similarly to that one described in fig.1. This display has brightness 75-80% in the on state.

Fig.8 shows the cross-section (a) and the top view (b) of the proposed display, fabricated according to the proposed method. On the bottom 1 and top 2 substrates containing the electrodes pattern deflecting dielectric elements 5 and 6 are deposited. On the bottom substrate 1 the area between the dielectric deflecting elements 5 is filled with a supplementary layer 7 which is made of the same material as the substrate (in a real process the grooves are made in the substrate in advance and after depositing electric conductive coating the grooves are filled

with the dielectric deflecting elements 5). On the top of the supplementary layer 7 conductive coating 3 is deposited. On the top of conductive coating 3 the aligning film 4 is displaced. Conventional spacers are used. Pixel abcd is surrounded by peripheral vertical lines and two horizontal lines placed at the bottom substrate 1. In other aspects the display is made similarly to that one described in fig.1. This display has brightness 75-80% in the on state.

Fig.9 shows the cross-section (a) and the top view (b) of the proposed display, fabricated according to the proposed method. On two plane glass substrates 1, 2 on the top of the conductive layer 3 deflecting dielectric elements 5, 6 are deposited. On one substrate, let us tell substrate 1, deflecting elements 5 have the form of crossing dielectric lines and on another substrate, for example 2, they look like dielectric lines. Lines on the both substrates 1, 2 have the width 5-6 μm , their height is 2.0-2.5 μm and the pitch - 100 μm . The substrates 1, 2 are aligned so, that the lines on substrate 2 cross the sides of the rectangles formed by the lines on the substrate 1 close to their centers. The crossings of the lines on substrate 1 with the lines on the substrate 2 are used as spacers. Planar aligning layer 4, for example AL-3046 (JSR), is deposited on both substrates 1, 2. The substrates 1, 2 are rubbed parallel to each other and perpendicular to the lines on the substrate 2. The space between the substrates 1, 2 is filled with a nematic liquid crystal ZLI-3497-000 possessing positive dielectric anisotropy. Single pixel abcd is surrounded by thicker vertical lines and two horizontal lines placed at the bottom substrate 1. So made display transmits 85-90% of light in the off state in crossed polaroids.

The proposed display with homeotropic alignment of the liquid crystal possessing negative dielectric anisotropy operates as following.

In the state without electric field LC molecules are aligned orthogonal to the substrates 1, 2 in the whole area except the slopes of the deflecting dielectric elements 5, 6, in the case their profile is from the liquid crystal side. In difference to [7,8], in the proposed display the slopes of the deflecting elements are either very steep (the angle with the substrate normally is bigger than 30-40°), or they are absent at all, in the case they are profiled from the substrate side. So distortions of the liquid crystal alignment either have limited size, or absent at all and do not perturb optical parameters of the display. Therefore in the off state this display does not transmit light in the crossed polaroids.

After applying electric field liquid crystal reorients not uniformly across the pixel area, but according to the direction of the parallel to the substrates component of the electric field which appears at the LC - dielectric interface. This way domains with different (including opposite) orientation of the liquid crystal appear within the pixel area. Under various observation angles different domains have different transmittance and transmittance of the pixel as a whole equals some averaged value. Due to this, inversion of the transmission levels of LC display under various observation angles is suppressed, similarly to the effect observed in [7,8]. To increase the viewing angle (to increase the contrast under oblique observation angles) phase retarders [2] may be used in the proposed display.

Display with LC possessing positive dielectric anisotropy and aligned parallel to the substrates operates in a similar way. The difference is that in the off state this display transmits light in crossed polaroids. After applying electric field LC reorients in different directions depending on the direction of the in-plane with the substrates component of the distorted electric field, which is created at the LC-dielectric interface. As the result, viewing characteristics become similar for different observation angles. In the on state display becomes non-transparent.

Summarizing the analysis of the proposed display and the method for its fabrication one can tell, that using conventional technology for making LC displays, in which only one technological photolithographic stage is added for making deflecting dielectric elements, it is easy to obtain display with wide viewing angle. The number of domains, their displacements, as well as proportion of their areas can be easily varied by varying photolithographically made pattern. Besides this, in transmission mode the losses of light are in the range of 10-20% in comparison with conventional single-domain displays, which are not essential for the desk-top displays.

CLAIMS

1. Liquid crystal display with plurality of pixels comprised of two plane substrates (1),
5 (2) with electric conductive layers deposited on the faced to each other sides of the substrates
(1), (2), covered with aligning layers (4) and with liquid crystal filling the space between the
substrates (1), (2), having deflecting elements (5), (6) and, if required, black matrix,
characterized in that
at least on one substrate deflecting elements (5), (6) are dielectric and are displaced over
10 electric conductive layers along the perimeter of each pixel.
2. Display according to claim 1, characterized in that, deflecting dielectric elements
(5), (6) are made of material with the resistivity equal, or exceeding the resistivity of the liquid
crystal.
3. Display according to claims 1-2, characterized in that, deflecting dielectric elements
15 (5), (6) are additionally displaced within the area of each pixel.
4. Display according to claims 1 or 2, characterized in that, the said black matrix is
made of deflecting dielectric elements (5), (6).
5. Display according to claims 1-4, characterized in that, deflecting dielectric elements
(5), (6) have the height in the interval 0.1-1 value of the liquid crystal thickness.
- 20 6. Display according to claim 1, characterized in that, deflecting dielectric elements
(5), (6) are displaced on both substrates (1), (2) over the electric conductive layers.
7. Display according to claim 6, characterized in that, deflecting dielectric elements
(5), (6) which are displaced over the electric conductive layers are made of different materials.
8. Display according to claims 1-7, characterized in that, deflecting dielectric elements
25 (5),(6) have varying height.
9. Liquid crystal display with plurality of pixels comprised of two plane substrates (1),
(2) with electric conductive layers deposited on the faced to each other sides of the substrates
(1), (2), covered with aligning layers (4) and with liquid crystal filling the space between the
substrates (1), (2), having deflecting elements (5), (6) and, if required, black matrix,
30 characterized in that
at least on one substrate deflecting elements are dielectric and placed over the electric
conductive layer and the area between them is filled with a supplementary coating (7).

10. Display according to claim 9, characterized in that, on the top of the supplementary coating (7) additional conductive layer is deposited.

11. Display according to claims 9 or 10, characterized in that, over the said dielectric deflecting elements (5), (6) and supplementary coating (7) additional layer is formed made of
5 the material of the said deflecting dielectric elements (5), (6).

12. Display according to claim 9, characterized in that, the said dielectric deflecting elements (5), (6) are made of material with the resistivity equal or exceeding that of the said liquid crystal.

13. Display according to claims 9-12, characterized in that, deflecting dielectric
10 elements (5), (6) are additionally displaced within the area of each pixel.

14. Display according to claims 9 or 13, characterized in that, the said black matrix is made of deflecting dielectric elements (5), (6).

15. Display according to claims 9-14, characterized in that, deflecting dielectric elements (5), (6) have the height exceeding 0.1 of the liquid crystal thickness.

16. Display according to claim 9, characterized in that, deflecting dielectric elements
15 (5), (6) are displaced on both substrates (1), (2) over the electric conductive layers.

17. Display according to claim 16, characterized in that, deflecting dielectric elements (5), (6) which are displaced over the electric conductive layers are made of different materials.

18. Display according to claims 9-16, characterized in that, deflecting dielectric
20 elements (5), (6) have varying height.

19. Display according to claim 9, characterized in that, the supplementary coating (7) is made of the same material as the substrate.

20. Display according to claim 19, characterized in that, on the top of the supplementary coating (7), which is made of the same material as the substrate, electric
25 conductive layer is deposited.

21. The method for making liquid crystal display with plurality of pixels comprised of depositing electric conductive and aligning layers on the faced to each other sides of two plane substrates, of subsequent filling liquid crystal in the space between the substrates, of forming deflecting elements and, if required, color filters and black matrix,

30 characterized in that

at least on one substrate deflecting elements are made dielectric and are displaced over the electric conductive layer.

22. The method according to claim 21, characterized in that, deflecting dielectric elements are made of material with the resistivity equal to or exceeding that of the liquid crystal.

23. The method according to claims 21 or 22, characterized in that, deflecting
5 dielectric elements are formed on both substrates.

24. The method according to claim 23, characterized in that, deflecting dielectric elements are formed of different materials

25. The method according to claims 21-24, characterized in that, the area between the deflecting dielectric elements is filled with supplementary coating.

10 26. The method according to claim 25, characterized in that, on the top of the supplementary coating additional electric conductive layer is deposited.

27. The method according to claims 24 or 25, characterized in that, on the top of the supplementary coating additional layer made of the material of the deflecting dielectric elements is deposited.

15 28. The method according to claim 21, characterized in that, the supplementary coating is made of the same material as the substrate.

29. The method according to claim 25, characterized in that, on the top of the supplementary coating electric conductive layer is deposited.

20 30. The method according to claims 21-23, characterized in that, the black matrix is made of the material of the deflecting dielectric elements.

31. The method according to claim 21, characterized in that, deflecting dielectric elements are formed with the height exceeding 0.1 of the liquid crystal thickness.

Check-boxes reserved for designating States (for the purposes of a national patent) which have become party to the PCT after issuance of this sheet:

- ☐
- ☐

Precautionary Designation Statement: In addition to the designations made above, the applicant also makes under Rule 4.9(b) all other designations which would be permitted under the PCT except any designation(s) indicated in the Supplemental Box as being excluded from the scope of this statement. The applicant declares that those additional designations are subject to confirmation and that any designation which is not confirmed before the expiration of 15 months from the priority date is to be regarded as withdrawn by the applicant at the expiration of that time limit. (Confirmation of a designation consists of the filing of a notice specifying that designation and the payment of the designation and confirmation fees. Confirmation must reach the receiving Office within the 15-month time limit.)

Notes concerning the request for fee reduction (EPO Form 1223/A)

(Please read before completing the form)

Introduction

- 1 The ADMINISTRATIVE COUNCIL of the European Patent Organisation decided on 14 June 1996 to reduce by 75% the EPO fees for the international search and preliminary examination carried out in respect of international applications filed by nationals of certain states. The text of the DECISION is reproduced overleaf.

Who can request the fee reduction

- 2 In order for the fee reduction to be granted, three conditions must be met:
 - 2.1 The decision under 1 is applicable to states which fulfil the requirements for the corresponding reduction in PCT fees payable to the International Bureau of WIPO¹. Relevant information may be found in the PCT Gazette, Section IV, the PCT Applicant's Guide, Annexes D(EP) and E(EP) and the Official Journal of the EPO, or may be obtained from the receiving Office.
 - 2.2 Please note that a fee reduction for the international search may only be granted if the EPO is designated as International Searching Authority (ISA). A fee reduction for the international preliminary examination may only be granted if the EPO is the International Preliminary Examining Authority (IPEA). The latter is the case only where the EPO or the Austrian, Spanish or Swedish Patent Office acted or is acting as ISA.
 - 2.3 If the applicant is a **natural person** he must be a national of **and** must have his residence in a state as indicated under 2.1. The country of nationality and residence must not necessarily be the same.
 - 2.4 If the applicant is a **legal person** such as a company or corporation (private or government-owned), a university or other organisation having legal personality or equivalent status, it must be constituted according to the national law of a state as indicated under 2.1 and have its principal place of business in such a state.
 - 2.5 Natural or legal persons who are **not** nationals of a state as indicated under 2.1, or who have their residence or principal place of business in a state which is not such a state, may have **neither a direct nor an indirect share or interest in the applicant(s)**. For example, companies operating as joint ventures with companies in member countries of the European Union or EFTA, in Australia, Canada, Japan or the USA, or companies having shareholders in such countries, would not be entitled to a fee reduction.
 - 2.6 If there are two or more applicants, **all** of them must meet these conditions at the time of filing the request for fee reduction.

How to request the fee reduction

- 3 The applicant(s) is (are) strongly advised to use the attached request form (EPO Form 1223/A). Although its use is not mandatory, if completed correctly it provides the authority responsible for deciding on the request with all the necessary information.

When to file the request with the competent receiving Office

- 4 The request for a reduction in the EPO fee for international search must be filed with the receiving Office. The request for a reduction in the EPO fee for international preliminary examination should be made simultaneously, even if the applicant has not yet decided whether to file a demand for preliminary examination (but see 5). **Applicants are recommended to submit the request for fee reduction together with the international application.**

When to file the request with the EPO

- 5 Where the applicant(s) at the time of filing the demand for international preliminary examination is (are) not the same as indicated in the international application as filed, or where the request for a reduction in the EPO fee for international preliminary examination has not been made together with that for a reduction in the EPO international search fee, **the request must be filed with the EPO as the competent IPEA. Applicants are recommended to submit the request together with the demand for preliminary examination.**
- 6 Where 4 applies, applicants are strongly recommended to submit a copy of the request for fee reduction filed with the receiving Office together with the demand for preliminary examination.

Precautionary payment of the full amount of fee(s)

- 7 To avoid the risk of loss of rights, applicants are advised to pay in due time the full amount of the EPO international search fee (see Rules 16.1(f), 15.4 PCT) and/or preliminary examination fee (due on filing the demand, see Rule 58.2 PCT). If the request for fee reduction is granted, the receiving Office or the EPO will refund 75% of the fee in question.

¹ (i.e. fees payable to the Receiving Office for the benefit of the International Bureau of WIPO)

KONOVANOV, Victor A.

CALCULATION OF PRESCRIBED FEES

1. TRANSMITTAL FEE 70 USD T

2. SEARCH FEE 312.5 USD S

International search to be carried out by

(If two or more International Searching Authorities are competent in relation to the international application, indicate the name of the Authority which is chosen to carry out the international search.)

3. INTERNATIONAL FEE

Basic Fee

The international application contains sheets.

first 30 sheets 455 USD b1

remaining sheets x additional amount = b2

Add amounts entered at b1 and b2 and enter total at B 455 USD B

Designation Fees

The international application contains designations.

11 x 105 = 1155 USD D

number of designation fees payable (maximum 11) amount of designation fee

Add amounts entered at B and D and enter total at I 402.5 USD I

(Applicants from certain States are entitled to a reduction of 75% of the international fee. Where the applicant is (or all applicants are) so entitled, the total to be entered at I is 25% of the sum of the amounts entered at B and D.)

4. FEE FOR PRIORITY DOCUMENT (if applicable) P

5. TOTAL FEES PAYABLE 715 USD

Add amounts entered at T, S, I and P. and enter total in the TOTAL box

TOTAL

☐ The designation fees are not paid at this time.

MODE OF PAYMENT

☐ authorization to charge
deposit account (see below)

☐ bank draft

☐ coupons

☐ cheque

☐ cash

☐ other (specify):

☐ postal money order

☐ revenue stamps

DEPOSIT ACCOUNT AUTHORIZATION (this mode of payment may not be available at all receiving Offices)

The RO/ ☐ is hereby authorized to charge the total fees indicated above to my deposit account.

☐ is hereby authorized to charge any deficiency or credit any overpayment in the total fees indicated above to my deposit account.

☐ is hereby authorized to charge the fee for preparation and transmittal of the priority document to the International Bureau of WIPO to my deposit account.

Deposit Account No.

Applicant KONOVALOV, Victor, A. et al	

1. The applicant is hereby notified of the date of receipt (except where the letters "NR" appear in the right-hand column) by the International Bureau of the priority document(s) relating to the earlier application(s) indicated below. Unless otherwise indicated by an asterisk appearing next to a date of receipt, or by the letters "NR", in the right-hand column, the priority document concerned was submitted or transmitted to the International Bureau in compliance with Rule 17.1(a) or (b).
2. This updates and replaces any previously issued notification concerning submission or transmittal of priority documents.
3. An asterisk(*) appearing next to a date of receipt, in the right-hand column, denotes a priority document submitted or transmitted to the International Bureau but not in compliance with Rule 17.1(a) or (b). In such a case, the attention of the applicant is directed to Rule 17.1(c) which provides that no designated Office may disregard the priority claim concerned before giving the applicant an opportunity, upon entry into the national phase, to furnish the priority document within a time limit which is reasonable under the circumstances.
4. The letters "NR" appearing in the right-hand column denote a priority document which was not received by the International Bureau or which the applicant did not request the receiving Office to prepare and transmit to the International Bureau, as provided by Rule 17.1(a) or (b), respectively. In such a case, the attention of the applicant is directed to Rule 17.1(c) which provides that no designated Office may disregard the priority claim concerned before giving the applicant an opportunity, upon entry into the national phase, to furnish the priority document within a time limit which is reasonable under the circumstances.

PCT

NOTIFICATION OF RECEIPT OF
RECORD COPY

(PCT Rule 24.2(a))

From the INTERNATIONAL BUREAU

To:

GORYACHKO, Mariam Sh.
P.O. Box 133
Minsk 220012
BÉLARUS

Date of mailing (day/month/year) 19 October 1998 (19.10.98)	IMPORTANT NOTIFICATION
Applicant's or agent's file reference	International application No. PCT/BY98/00008

The applicant is hereby notified that the International Bureau has received the record copy of the international application as detailed below.

Name(s) of the applicant(s) and State(s) for which they are applicants:

KONOVALOV, Victor, A. et al (all designated States)

International filing date : 25 September 1998 (25.09.98)

Priority date(s) claimed : 06 August 1998 (06.08.98)

Date of receipt of the record copy
by the International Bureau : 15 October 1998 (15.10.98)

List of designated Offices :

EA : AM, AZ, BY, KG, KZ, MD, RU, TJ, TM

EP : AT, BE, CH, CY, DE, DK, ES, FI, FR, GB, GR, IE, IT, LU, MC, NL, PT, SE

OA : BF, BJ, CF, CG, CI, CM, GA, GN, GW, ML, MR, NE, SN, TD, TG

National : AL, AM, AT, AU, AZ, BA, BB, BG, BR, BY, CA, CH, CN, CU, CZ, DE, DK, EE, ES, FI, GB, GE, GH, GM, HR, HU, ID, IL, IS, JP, KE, KG, KP, KR, KZ, LC, LK, LR, LS, LT, LU, LV, MD, MG, MK, MN, MW, MX, NO, NZ, PL, PT, RO, RU, SD, SE, SG, SI, SK, SL, TJ, TM, TR, TT, UA, UG, US, UZ, VN, YU, ZW

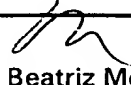

ATTENTION

The applicant should carefully check the data appearing in this Notification. In case of any discrepancy between these data and the indications in the international application, the applicant should immediately inform the International Bureau.

In addition, the applicant's attention is drawn to the information contained in the Annex, relating to:

- ☒ time limits for entry into the national phase
- ☒ confirmation of precautionary designations
- ☒ requirements regarding priority documents

A copy of this Notification is being sent to the receiving Office and to the International Searching Authority.

The International Bureau of WIPO 34, chemin des Colombettes 1211 Geneva 20, Switzerland Facsimile No. (41-22) 740.14.35	Authorized officer:  Beatriz Morariu Telephone No. (41-22) 338.83.38

THIS PAGE BLANK (USPTO)

INFORMATION ON TIME LIMITS FOR ENTERING THE NATIONAL PHASE

The applicant is reminded that the "national phase" must be entered before each of the designated Offices indicated in the Notification of Receipt of Record Copy (Form PCT/IB/301) by paying national fees and furnishing translations, as prescribed by the applicable national laws.

The time limit for performing these procedural acts is **20 MONTHS** from the priority date or, for those designated States which the applicant elects in a demand for international preliminary examination or in a later election, **30 MONTHS** from the priority date, provided that the election is made before the expiration of 19 months from the priority date. Some designated (or elected) Offices have fixed time limits which expire even later than 20 or 30 months from the priority date. In other Offices an extension of time or grace period, in some cases upon payment of an additional fee, is available.

In addition to these procedural acts, the applicant may also have to comply with other special requirements applicable in certain Offices. It is the applicant's responsibility to ensure that the necessary steps to enter the national phase are taken in a timely fashion. Most designated Offices do not issue reminders to applicants in connection with the entry into the national phase.

For detailed information about the procedural acts to be performed to enter the national phase before each designated Office, the applicable time limits and possible extensions of time or grace periods, and any other requirements, see the relevant Chapters of Volume II of the PCT Applicant's Guide. Information about the requirements for filing a demand for international preliminary examination is set out in Chapter IX of Volume I of the PCT Applicant's Guide.

GR and ES became bound by PCT Chapter II on 7 September 1996 and 6 September 1997, respectively, and may, therefore, be elected in a demand or a later election filed on or after 7 September 1996 and 6 September 1997, respectively, regardless of the filing date of the international application. (See second paragraph above.)

Note that only an applicant who is a national or resident of a PCT Contracting State which is bound by Chapter II has the right to file a demand for international preliminary examination.

CONFIRMATION OF PRECAUTIONARY DESIGNATIONS

This notification lists only specific designations made under Rule 4.9(a) in the request. It is important to check that these designations are correct. Errors in designations can be corrected where precautionary designations have been made under Rule 4.9(b). The applicant is hereby reminded that any precautionary designations may be confirmed according to Rule 4.9(c) before the expiration of 15 months from the priority date. If it is not confirmed, it will automatically be regarded as withdrawn by the applicant. There will be no reminder and no invitation. Confirmation of a designation consists of the filing of a notice specifying the designated State concerned (with an indication of the kind of protection or treatment desired) and the payment of the designation and confirmation fees. Confirmation must reach the receiving Office within the 15-month time limit.

REQUIREMENTS REGARDING PRIORITY DOCUMENTS

For applicants who have not yet complied with the requirements regarding priority documents, the following is recalled.

Where the priority of an earlier national, regional or international application is claimed, the applicant must submit a copy of the said earlier application, certified by the authority with which it was filed ("the priority document") to the receiving Office (which will transmit it to the International Bureau) or directly to the International Bureau, before the expiration of 16 months from the priority date, provided that any such priority document may still be submitted to the International Bureau before that date of international publication of the international application, in which case that document will be considered to have been received by the International Bureau on the last day of the 16-month time limit (Rule 17.1(a)).

Where the priority document is issued by the receiving Office, the applicant may, instead of submitting the priority document, request the receiving Office to prepare and transmit the priority document to the International Bureau. Such request must be made before the expiration of the 16-month time limit and may be subjected by the receiving Office to the payment of a fee (Rule 17.1(b)).

If the priority document concerned is not submitted to the International Bureau or if the request to the receiving Office to prepare and transmit the priority document has not been made (and the corresponding fee, if any, paid) within the applicable time limit indicated under the preceding paragraphs, any designated State may disregard the priority claim, provided that no designated Office may disregard the priority claim concerned before giving the applicant an opportunity to furnish the priority document within a time limit which is reasonable under the circumstances.

Where several priorities are claimed, the priority date to be considered for the purposes of computing the 16-month time limit is the filing date of the earliest application whose priority is claimed.
